Avoid Unnecessary Sedation with Powerful ERG Testing

An electroretinogram (ERG) test provides easy and reliable guidance for medical professionals to understand and assess functional changes that may impact the patient’s vision by looking at the retina’s response to light. The RETeval device helps doctors to make an objective, functional assessment.

PORTABLE VISUAL ELECTRODIAGNOSTIC SYSTEM

Get valuable information for a faster, more effective diagnosis and easy monitoring of vision-threatening diseases

COMMON USES FOR FULL FLASH AND FLICKER ERG TESTS

- Nystagmus
- Leber’s Congenital Amaurosis
- Congenital Stationary Night Blindness
- Achromatopsia
- Retinopathy of Prematurity
- Malingering
- Unexplained Vision Loss
- Trouble Seeing in the Dark
- Changes in Color Vision

MINIMIZE NEED FOR SEDATION

Fewer tears, less rescheduling, low noise interference — complete testing all in one fast visit

PORTABLE FAST EASY EMR CAPABLE STANDARD OR CUSTOM PROTOCOLS
"The RETeval device brings my practice a truly portable, easy to use ERG solution. We have the option of obtaining a standard ERG with skin electrodes or corneal electrodes. We were impressed with the ease of acquisition, the quality of the automatic reporting function and the affordability. The ability to download reports into our EMR facilitates timely record keeping and communication with referring doctors. We appreciate the overall quality of the device."
